

Augmentomy

WE ARE CREATING NEW PERSPECTIVES IN MEDICINE.

For the visualization of medical 3D data, such as CT or MRI scans, 2D monitors are used according to the current state of the art. The basic idea of Augmentomy is to visualize exactly this data in real 3D using Augmented Reality (AR). The representation in AR offers physicians a deeper understanding of the anatomy of their patients and thus enables more precise planning of medical interventions. By combining AR and Artificial Intelligence (AI), these 3D medical scans will also provide physicians with enhanced information during surgery, allowing for faster and less invasive procedures.
