OPED

We revolutionize green mobility engineering with our AI-powered design optimization software for automotive powertrains.

Massively accelerate the product development process and improve products with AI – this is possible with the industry-approved software solution OPED, which enables a fully automatic design of electrified powertrains.

Based on vehicle requirements, the software automatically generates optimal powertrain systems, which consist of power electronics, electric machine and gearbox. Artificial intelligence is used to simultaneously optimize the powertrain regarding multiple development objectives and KPIs – in particular cost, package, performance, energy efficiency, and sustainability.

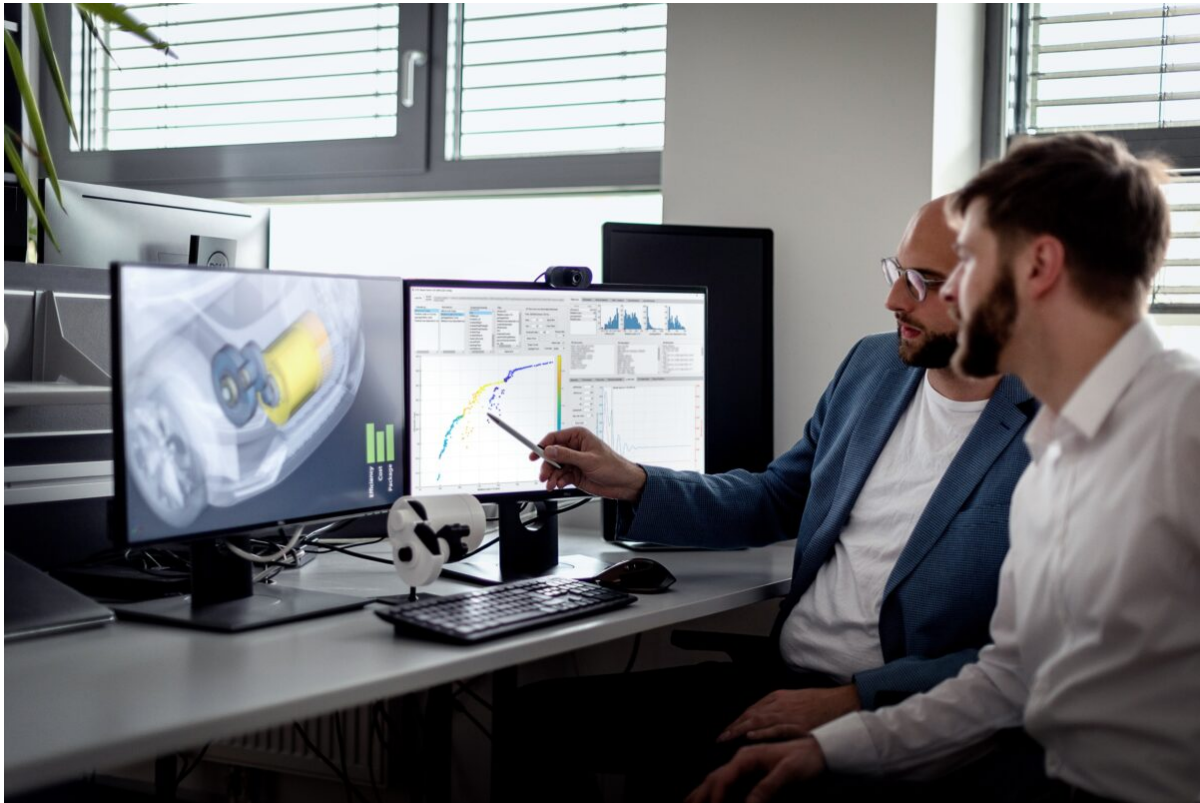

Production

Energy de

Scope 3 emi

With OPED, engineers develop competitive products with agility and in a significantly shorter time. The software is already established in practical use at a leading global automotive supplier – with high potential for scaling across other suppliers and OEMs.
