SAVE TIME AND WRITE COMPREHENSIBLE SOFTWARE REQUIREMENTS

storywise is a software specialized in creating software requirements. Through a tailor-made interface, clever input options & shortcuts, a good structure, and the meaningful use of AI in the right places, requirements engineers are supported in their work. The wizard can convert the text of the customer into requirements –retaining the information which sentence belongs to which requirement. The tailorable output in word files or pdf helps to create an understanding what the project really is about.

The results are more comparable, easier to understand for the customer, and more comprehensive, reducing thereby the potential for conflict between the client and contractor. The results, with all the information, can be transferred to a project management tool like JIRA with a single click.
